

## CS320 Web and Internet Programming

### JSP Action Elements

Chengyu Sun  
California State University, Los Angeles

## JSP Action Elements

```
<prefix:action attr1="value1" attr2="value2" ...>  
    action_body  
</prefix:action>
```

```
<prefix:action attr1="value1" attr2="value2" .../>
```

## Action Types

- ◆ JSP Standard
- ◆ JSP Standard Tag Library (JSTL)
- ◆ Custom

## JSP Standard Actions

- ◆ Bean
  - <jsp:useBean>
  - <jsp:getProperty>
  - <jsp:setProperty>
- ◆ Attribute
  - <jsp:attribute>
  - <jsp:body>
- ◆ Document
  - <jsp:plugin>
  - <jsp:element>
  - <jsp:text>
- ◆ Multi-page
  - <jsp:include>
  - <jsp:forward>
  - <jsp:param>

## JavaBeans

- ◆ Initially designed for GUI builders
- ◆ *Beans* support
  - Introspection
  - Customization
  - Events
  - Properties
  - Persistence

## JavaBeans for Dummies ...

```
public class IamABean {  
    int prop1;  
    String prop2;  
    boolean prop3;  
  
    public IamABean() { prop1 = 0; prop2=""; prop3=false; }  
  
    public getProp1() { return prop1; }  
  
    public getProp2() { return prop2; }  
  
    public setProp2( String s ) { prop3 = new String(s); }  
  
    public isProp3() { return prop3; }  
  
}
```

## ... JavaBeans for Dummies

- ◆ A zero-argument constructor
- ◆ No public class variables
- ◆ Property xxx
  - getXxx() or isXxx()
  - setXxx()

## VisitorsWithBeans.jsp

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0 Transitional//EN">
<HTML>
<HEAD><TITLE>Visitors with Beans</TITLE> </HEAD>

<jsp:useBean id="visitor" class="edu.calstatela.cs.csun.Visitor" />

<BODY>Hello, you are visitor
No.<jsp:getProperty name="visitor" property="fake" />,
or actual visitor No.<jsp:getProperty name="visitor" property="real" />.

<!-- Page created on <%= new java.util.Date() %> -->
</BODY>
</HTML>
```

## Bean Tags and Attributes

- |   |  |
|---|--|
| ◆ <b>jsp:useBean</b> <ul style="list-style-type: none"><li>▪ class</li><li>▪ id</li><li>▪ scope<ul style="list-style-type: none"><li>• page (default)</li><li>• request</li><li>• session</li><li>• application</li></ul></li></ul> | ◆ <b>jsp:getProperty</b> <ul style="list-style-type: none"><li>▪ name</li><li>▪ property</li></ul>                 |
|   | ◆ <b>jsp:setProperty</b> <ul style="list-style-type: none"><li>▪ name</li><li>▪ property</li><li>▪ value</li></ul> |

## Visitor.java

```
package edu.calstatela.cs.csun;

public class Visitor {

    int real;

    public Visitor() { real = 0; }

    public int getReal() { return real++; }

    public int getFake() { return (int) (Math.random() * 1000000); }

}
```

## Java Packages

- ◆ *Java does not permit a class without a package qualifier to be used in a class that belongs to a package. (Enforced in JDK 1.4)*
- ◆ Naming convention
- ◆ Package name ⇔ path

## Deploy JSP with Packages on the CS Server

- ◆ JSP files under ~/public\_html
- ◆ Package directory under ~/public\_html/WEB-INF/classes
- ◆ Access whatever.jsp as http://cs.calstatela.edu:8280/~username/whatever.jsp

## Example of setProperty

```
<jsp:setProperty name="fb" property="cls" value="cs320"/>

<jsp:setProperty name="fb" property="fname"
value='<%= request.getParameter("fname")%>'/>

<jsp:setProperty name="fb" property="age">
<jsp:attribute name="value" trim="true">
<%= request.getParameter("age")%>
</jsp:attribute>
</jsp:setProperty>

<jsp:setProperty name="fb" property="lname"/>
<jsp:setProperty name="fb" property="*/>
```

## Tag Libraries

- ◆ JSTL
- ◆ Custom Tag Libraries
  - Java classes
  - Tag files

## VisitorsTL.jsp

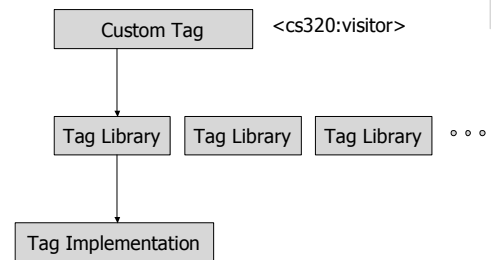

```
<%@ taglib prefix="cs320" uri="http://www.calstatela.edu/csun/cs320" %>

<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0 Transitional//EN">
<HTML>
<HEAD><TITLE>Visitors with Tag Library</TITLE> </HEAD>

<BODY>Hello, you are visitor No.<cs320:visitor fake="true"/>,
or actual visitor No.<cs320:visitor fake="false"/>.

<!-- Page created on <%= new java.util.Date() %> -->
</BODY>
</HTML>
```

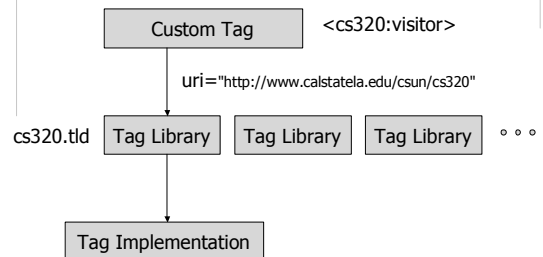

## From Custom Tags to Their Implementations

## taglib Directive

- ◆ prefix – library name used in this page
- ◆ uri – library identifier
  - Must be globally unique
  - Must match the library identifier in the TLD
  - Convention – URL-like

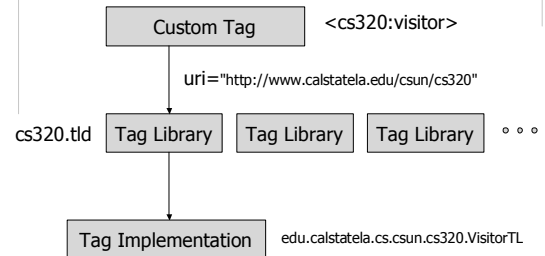

## From Custom Tags to Their Implementations

## cs320.tld

```
<?xml version="1.0" ?>
<taglib>
  <uri>http://www.calstatela.edu/csun/cs320</uri>
  <tlibversion>1.0</tlibversion>
  <jspversion>2.0</jspversion>
  <shortname>CS320 Custom Tag Samples</shortname>
  <info> Custom tag samples for CS320</info>
  <tag>
    <name>visitor</name>
    <tagclass>edu.calstatela.cs.csun.cs320.VisitorTL</tagclass>
    <bodycontent>empty</bodycontent>
    <attribute>
      <name>fake</name>
      <required>true</required>
    </attribute>
  </tag>
</taglib>
```

## From Custom Tags to Their Implementations

## VisitorTL.java ...

```
package edu.calstatela.cs.csun.cs320;

import java.io.*;
import javax.servlet.jsp.*;
import javax.servlet.jsp.tagext.*;

public class VisitorTL extends SimpleTagSupport {

    static int    actualVisitor = 0;

    // attributes
    boolean fake;

    public VisitorTL() { fake = false; }
```

## ... VisitorTL.java

```
public void setFake( String fake )
{
    this.fake = Boolean.valueOf(fake).booleanValue();
}

public void doTag() throws IOException
{
    JspWriter out = getJspContext().getOut();
    out.print( fake ? (int) (Math.random()*1000000) : actualVisitor++ );
}

} // end of class VisitorTL.java
```

## Deploy a Custom Tag Library

- ◆ Class files
  - src/edu/calstatela/cs/csun/cs320/\*.class
- ◆ TLD file
  - src/META-INF/cs320.tld
- ◆ Create jar file under src/
  - jar -cvf cs320.jar edu META-INF
- ◆ cs320.jar goes to
  - cs server: ~/public\_html/WEB-INF/lib
  - On your home machine:
    - \$(TOMCAT)/webapp/ROOT/WEB-INF/lib

## JSP Standard Tag Library (JSTL)

Library	URI	Prefix
Core	<a href="http://java.sun.com/jsp/jstl/core">http://java.sun.com/jsp/jstl/core</a>	c
XML Processing	<a href="http://java.sun.com/jsp/jstl/xml">http://java.sun.com/jsp/jstl/xml</a>	x
I18N Formatting	<a href="http://java.sun.com/jsp/jstl/fmt">http://java.sun.com/jsp/jstl/fmt</a>	fmt
Database Access	<a href="http://java.sun.com/jsp/jstl/sql">http://java.sun.com/jsp/jstl/sql</a>	sql
Functions	<a href="http://java.sun.com/jsp/jstl/functions">http://java.sun.com/jsp/jstl/functions</a>	fn

<http://java.sun.com/products/jsp/jstl/1.1/docs/tlddocs/index.html>

## JSTL Examples

- ◆ jstl1.jsp
- ◆ jstl2.jsp
  - `<c:out value="${1+2+3}"/>`

## Setting Action Attribute Values

- ◆ JSP Expression
- ◆ `<jsp:attribute>`
- ◆ JSP Expression Language (EL)

```
<jsp:setProperty name="fb" property="fname" value='<%= request.getParameter("fname")%>' />

<jsp:setProperty name="fb" property="age">
  <jsp:attribute name="value" trim="true">
    <%= request.getParameter("age")%>
  </jsp:attribute>
</jsp:setProperty>

<c:out value="${1+2+3}"/>
```

## EL Operators and Implicit Variables

- |                          |                |
|--------------------------|----------------|
| ◆ +, -, *, /, %          | ◆ param        |
| ◆ ==, !=, <, >, <=, >=   | ◆ paramValues  |
| ◆ eq, ne, lt, gt, le, ge | ◆ header       |
| ◆ &&,   , !              | ◆ headerValues |
| ◆ and, or, not           | ◆ cookie       |
| ◆ ?:                     | ◆ ...          |
| ◆ .                      |                |
| ◆ []                     |                |
| ◆ empty                  |                |

## JSTL Core

- |  |  |
|--|--|
| ◆ <code>&lt;c:out&gt;</code> <ul style="list-style-type: none"><li>▪ value</li></ul>   | ◆ <code>&lt;c:if&gt;</code> <ul style="list-style-type: none"><li>▪ test</li><li>▪ var</li><li>▪ scope</li></ul> |
| ◆ <code>&lt;c:forEach&gt;</code> <ul style="list-style-type: none"><li>▪ items</li><li>▪ var</li><li>▪ begin, end, step</li></ul>          | ◆ <code>&lt;c:choose&gt;</code>  |
| ◆ <code>&lt;c:forToken&gt;</code> <ul style="list-style-type: none"><li>▪ items, delims</li><li>▪ var</li><li>▪ begin, end, step</li></ul> | ◆ <code>&lt;c:when&gt;</code> <ul style="list-style-type: none"><li>▪ test</li></ul>                             |
|  | ◆ <code>&lt;c:otherwise&gt;</code>   |

## JSTL Functions

- |                                |                                     |
|--------------------------------|-------------------------------------|
| ◆ <code>fn:length()</code>     | ◆ <code>fn:toUpperCase()</code>     |
| ◆ <code>fn:contains()</code>   | ◆ <code>fn:toLowerCase()</code>     |
| ◆ <code>fn:startsWith()</code> | ◆ <code>fn:substring()</code>       |
| ◆ <code>fn:endsWith()</code>   | ◆ <code>fn:substringAfter()</code>  |
| ◆ <code>fn:indexOf()</code>    | ◆ <code>fn:substringBefore()</code> |
| ◆ <code>fn:replace()</code>    | ◆ <code>fn:trim()</code>            |
| ◆ <code>fn:split()</code>      |                                     |
