

## CS520 Web Programming

Introduction to AJAX

Chengyu Sun  
California State University, Los Angeles

## Browser As The New OS

- ◆ Application can be used from anywhere
- ◆ Easy application distribution and deployment
- ◆ Greatly simplifies system administration
  - No software to download, install, and update
  - Centralized data management

*So why it didn't happen??*

## Disadvantages of Web Applications

- ◆ Usually requires high bandwidth
- ◆ Storing data remotely
  - Privacy
  - Reliability
- ◆ Limited number of GUI components
  - Compared to, e.g.  
<http://java.sun.com/docs/books/tutorial/ui/features/compWin.html>
- ◆ *Interactivity issues*

## Interactivity Issues

- ◆ Conventional GUI application
  - Rich event model
  - Responsive
    - No network delay
    - Partial redraw
- ◆ Web application
  - Simple request-response model
  - Not so responsive
    - Send request, wait for response
    - Full page refresh

## HTML Event Models

- ◆ HTML 4 Event Model
  - HTML 4.01 Specification - <http://www.w3.org/TR/REC-html40/>
  - Limited features but portable
- ◆ Standard Event Model
  - DOM Level 2 HTML Specification - <http://www.w3.org/TR/2003/REC-DOM-Level-2-HTML-20030109/>
  - Fully featured but less portable
- ◆ Vendor specific event models

## Events and Event Handler

- ◆ Events
  - onfocus, onblur, onkeypress, onkeydown, onkeyup, onclick, ondblclick, onmousedown, onmouseup, onmousemove, onmouseover ...
- ◆ Specify event handler
  - `<element event="code">`
  - For example:  

```
<button onclick="clickHandler();">click</button>
```

## Example: Event Handling with JavaScript

- ◆ `jl.html`
- ◆ Disclaimer: all my JavaScript code is only tested under Firefox

## JavaScript

- ◆ Interpreted language
- ◆ Originally developed by Netscape
- ◆ Syntax is similar to Java

## Core JavaScript

- ◆ Mainly covers language syntax, which is kind of similar to Java
- ◆ Global Object
  - Created by a JavaScript interpreter
  - *Global variables* and *global methods* are simply variables and methods of this object

## Client-Side JavaScript

- ◆ Embed JavaScript in HTML
  - `<script>`
    - ◆ `type="text/javascript"`
    - ◆ `language="JavaScript"`
    - ◆ `src="path_to_script_file"`
- ◆ Run inside a browser
- ◆ Window is the global object

## The Window Object

## Document Object Model (DOM)

- ◆ Representing documents as objects so they can be manipulated in a programming language.

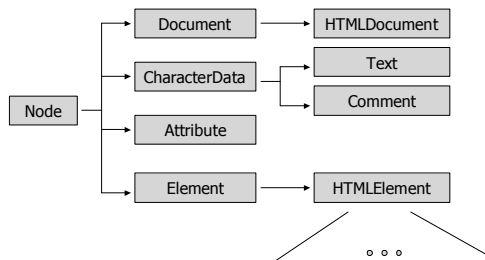

## An HTML Document

```
<html>
<head><title>JavaScript Example</title></head>
<body>
  <h1>JavaScript Example</h1>
  <p>Some content.</p>
</body>
</html>
```

## DOM Representation

## Nodes

## Manipulate a Document

- ◆ Find elements
- ◆ Modify elements
- ◆ Create elements

## Find Elements

- ◆ `document.getElementById()`
- ◆ `document.getElementsByName()`
- ◆ `document.getElementsByTagName()`

## Modify Elements

- ◆ `HTMLElement` properties and methods
  - IE
    - `innerHTML`
    - `innerText`
    - `insertAdjacentHTML()`
    - `insertAdjacentText()`
  - Netscape/Mozilla
    - `innerHTML`
  - Element-specific

## Create Elements

- ◆ document
  - createElement()
  - createTextNode()
- ◆ node
  - setAttribute(), removeAttribute()
  - appendChild(), removeChild()
  - insertBefore(), replaceChild()

## Communicate with Server

- ◆ The request-response model is still a limiting factor in user interactivity
- ◆ Solution: XMLHttpRequest
  - A JavaScript object
    - ◆ Send HTTP request
    - ◆ Parse XML response
  - *Response can be handled asynchronously*

## XMLHttpRequest - Properties

- ◆ onreadystatechange
- ◆ readyState
  - 0 – uninitialized
  - 1 – loading
  - 2 – loaded
  - 3 – interactive
  - 4 – complete
- ◆ status
- ◆ statusText
- ◆ responseBody
- ◆ responseStream
- ◆ responseText
- ◆ responseXML

## XMLHttpRequest - Methods

- ◆ abort()
- ◆ getAllResponseHeaders()
- ◆ getResponseHeader( header )
- ◆ open( method, url, asyncFlag, username, password )
  - asyncFlag, username, password are optional
- ◆ send( messageBody )
- ◆ setRequestHeader( name, value )

## An XMLHttpRequest Example

- ◆ A client script sends an XMLHttpRequest
- ◆ A servlet responds with an XML message
- ◆ When the message arrives on the client, a *callback function* is invoked to update the document

## About the Example

- ◆ clickHandler()
- ◆ newXMLHttpRequest()
- ◆ updateDocument()
- ◆ getReadyStateHandler()

## AJAX

- ◆ AJAX = JavaScript + XMLHttpRequest
- ◆ Asynchronous JavaScript and XML
- ◆ Characteristics of AJAX
  - Non-blocking – the server response is handled asynchronously with a callback function
  - Partial page update using JavaScript

## More About AJAX

- ◆ The technologies have been around for several years
- ◆ The recent buzz seems to be started by Google Maps
  - Vs. Yahoo Maps (The Old Version)
- ◆ Now it's "Web 2.0"!

## AJAX Frameworks and Libraries

- ◆ [http://ajaxpatterns.org/Ajax\\_Frameworks](http://ajaxpatterns.org/Ajax_Frameworks)

## More Widgets, Less JavaScript

- ◆ Simplifies XMLHttpRequest creation and response handling
  - E.g. Taconite
- ◆ AJAX widgets libraries
  - E.g. Ajax JSP Tag Library
- ◆ Full-fledged web development frameworks
  - E.g. ZK, GWT
- ◆ AJAX widgets for existing web development frameworks
  - E.g. ASP, JSF

## More Ajax Examples

- ◆ A Taconite Example
  - Simplifies request creation
  - Response generated by JSP
  - No JavaScript required to update page
- ◆ CSNS
  - Toggle file public
  - Add section
