

CS520 Web Programming Introduction to Ajax

Chengyu Sun
California State University, Los Angeles

The Desktop Experience

The Desktop Advantage

- ◆ Large selection of GUI components
- ◆ Rich event model
- ◆ Low response time

HTML Event Models

- ◆ HTML 4 Event Model
 - HTML 4.01 Specification - <http://www.w3.org/TR/REC-html40/interact/scripts.html#h-18.2.3>
 - Limited but widely supported
- ◆ Standard Event Model
 - DOM Level 2 HTML Specification - <http://www.w3.org/TR/DOM-Level-2-Events/events.html>
- ◆ Browser specific event models

Events and Event Handler

- ◆ Events
 - onfocus, onblur, onkeypress, onkeydown, onkeyup, onclick, ondblclick, onmousedown, onmouseup, onmousemove, onmouseover ...
- ◆ Specify event handler
 - `<element event="code">`
 - For example:

```
<button onclick="clickHandler();">click</button>
```

Example: Event Handling

- ◆ j1.html
 - Uses X Library from <http://cross-browser.com/>
 - *Handles events*
 - *Modifies the HTML document*

JavaScript

- ◆ Interpreted language
- ◆ Originally developed by Netscape
- ◆ Syntax is similar to Java

Core JavaScript

- ◆ Mainly covers language syntax, which is similar to Java
- ◆ Some "un-Java-like" language features
 - Object creation
 - Functions as first-class citizens

Object Creation – Approach 1

```
var car = new Object();
car.make = 'Honda';
car.model = 'Civic';
car.year = 2001;

var owner = new Object();
owner.name = 'Chengyu';

car.owner = owner;
```

- ◆ A JavaScript object consists of a set of properties which can be added dynamically

Object Creation – Approach 2

```
var car = {
  make: 'Honda',
  model: 'Civic',
  year: 2001,
  owner: {
    name: 'Chengyu'
  }
};
```

- ◆ Object literal

Functions as First-class Citizens

- ◆ In JavaScript, functions are considered objects like other object types
 - Assigned to variables
 - Assigned as a property of an object
 - Passed as a parameter
 - Returned as a function result
 - *Function literals* (i.e. functions without names)

Function Examples

```
function foo() {
  alert('foo');
}
// Regular function creation

bar = function() {
  alert('bar');
}
// • Function literal
// • Function assignment

setTimeout( bar, 5000 );
// Function as parameter

setTimeout( function() {
  alert('foobar');},
  5000 );
// Function literal as parameter
```

Client-Side JavaScript

◆ Embed JavaScript in HTML

- `<script>`
 - ◆ `type="text/javascript"`
 - ◆ `language="JavaScript"`
 - ◆ `src="path_to_script_file"`

◆ Run inside a browser

Processing an HTML Document

```
<html>
<head><title>JavaScript Example</title></head>
<body>
  <h1>JavaScript Example</h1>
  <p>Some content.</p>
</body>
</html>
```

◆ As a text file – very difficult

◆ As an object

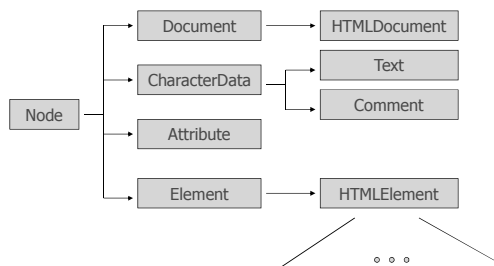

Document Object Model (DOM)

- ◆ Representing documents as objects so they can be processed more easily by a programming language

DOM Representation

Nodes

Manipulate a Document

- ◆ Find Elements
- ◆ Modify Elements
- ◆ Create Elements

Find Elements

- ◆ `document.getElementById()`
- ◆ `document.getElementsByName()`
- ◆ `document.getElementsByTagName()`

Modify Elements ...

- ◆ HTMLElement properties and methods
 - IE
 - ◆ `innerHTML`
 - ◆ `innerText`
 - ◆ `insertAdjacentHTML()`
 - ◆ `insertAdjacentText()`
 - Netscape/Mozilla
 - ◆ `innerHTML`
 - Element-specific

... Modify Elements

- ◆ node
 - `setAttribute()`, `removeAttribute()`
 - `appendChild()`, `removeChild()`
 - `insertBefore()`, `replaceChild()`

Create Elements

- ◆ document
 - `createElement()`
 - `createTextNode()`

Example: Document Manipulation

- ◆ `j2.html`
 - Read and display the text input
 - *Display "Hello <name>??"*
 - *Add text input to table??*

Communicate with Server

- ◆ The request-response model is still a limiting factor in user interactivity
- ◆ Solution: XMLHttpRequest
 - A JavaScript object
 - ◆ Send request and receive response
 - Response can be handled *asynchronously*
 - ◆ Do not need to wait for the response

Understand Asynchronous

◆ Synchronous

```
send( request );  
// wait for response  
process( response );  
// do other things  
...
```

◆ Asynchronous

```
send( request );  
// don't wait for response  
process( response );  
// do other things  
...
```

*What's the problem??
What's the solution??*

An XMLHttpRequest Example

◆ a1.html

- A client scripts sends an XMLHttpRequest
- A servlet responses with a random number
- When the message arrives on the client, a *callback function* is invoked to update the document

About the Example

- ◆ clickHandler()
- ◆ newXMLHttpRequest()
- ◆ updateDocument()
- ◆ getReadyStateHandler()

XMLHttpRequest - Properties

- ◆ onreadystatechange
- ◆ readyState
 - 0 – uninitialized
 - 1 – loading
 - 2 – loaded
 - 3 – interactive
 - 4 – complete
- ◆ status
- ◆ statusText
- ◆ responseBody
- ◆ responseStream
- ◆ responseText
- ◆ responseXML

XMLHttpRequest - Methods

- ◆ abort()
- ◆ getAllResponseHeaders()
- ◆ getResponseHeader(header)
- ◆ open(method, url, asyncFlag, username, password)
 - asyncFlag, username, password are optional
- ◆ send(messageBody)
- ◆ setRequestHeader(name, value)

So What is Ajax?

- ◆ Asynchronous JavaScript and XML
 - <http://www.adaptivepath.com/ideas/essays/archives/000385.php>
 - JavaScript + XMLHttpRequest
- ◆ Characteristics of Ajax
 - Non-blocking – the server response is handled asynchronously with a callback function
 - Partial page update using JavaScript

More About AJAX

- ◆ XMLHttpRequest used to be an IE specific feature that received little attention
- ◆ It's all started by Google Maps
- ◆ The beginning of "Web 2.0"

Key Elements of an Ajax Operation

Problems of Plain JavaScript + XMLHttpRequest

- ◆ Each browser has their own JavaScript implementation
 - Code that works on some browsers may not work on others
- ◆ Lack of pre-made GUI components
- ◆ Implementing Ajax operations is quite tedious

JavaScript/Ajax Frameworks and Libraries

- ◆ http://en.wikipedia.org/wiki/List_of_Ajax_frameworks
 - Cross-browser compatibility
 - ◆ New JavaScript API, e.g. X Lib, JQuery
 - ◆ New language, e.g. ZK, Taconite
 - Pre-made, Ajax-enabled GUI component
 - Simplify the implementation of Ajax operations

One Library to Rule Them All - JQuery

- ◆ JQuery - <http://jquery.com/>
- ◆ JQuery UI - <http://jqueryui.com/>
- ◆ The increasing market share of JQuery
 - <http://trends.builtwith.com/javascript>
 - <http://trends.builtwith.com/javascript/JQuery>

A JQuery Example

- ◆ a2.html
 - The document ready handler
 - \$(function(){...})
 - ◆ Similar to window.onload but better
 - Selectors \$('#clickBtn') and \$('#number')
 - Events click()
 - Ajax call \$.ajax()

Readings

- ◆ AJAX: Getting Started - https://developer.mozilla.org/en/AJAX/Getting_Started
- ◆ *jQuery in Action* by Bear Bibeault and Yehuda Katz

What's in the Future? – RIA vs. Ajax and HTML5

- ◆ Rich Internet Application (RIA) platforms
 - Flex, Silverlight, JavaFX
- ◆ vs. Ajax and HTML5
 - Proprietary
 - Require browser plugins
 - Rich GUI features
 - Good development tool support
