CS520 Web Programming
Full Text Search

Chengyu Sun
California State University, Los Angeles

Search Text

- Web search
- Desktop search
- Applications
  - Search posts in a bulletin board
  - Search product descriptions at an online retailer
  - …

Database Query

- Find the posts regarding "SSHD login errors".

```
select * from posts
        where content like '%SSHD login errors%';
```

Here are the steps to take to fix the SSHD login errors: …

Please help! I got SSHD login errors!

Problems with Database Queries

Please help! I got an error when I tried to login through SSHD!

There a problem recently discovered regarding SSHD and login. The error message is usually …

The solution for sshd/login errors: …

- And how about performance??

Full Text Search (FTS)

- More formally known as Information Retrieval (IR)
- Search LARGE amount of textual data

Characteristics of FTS

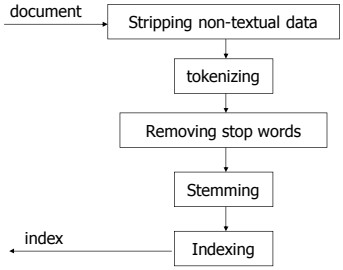
- Vs. Databases
  - "Fuzzy" query processing
  - Relevancy ranking

Accuracy of FTS

$$\text{Precision} = \frac{\#\text{ of relevant documents retrieved}}{\#\text{ of documents retrieved}}$$

$$\text{Recall} = \frac{\#\text{ of relevant documents retrieved}}{\#\text{ of relevant documents}}$$

Journey of a Document



Document

- Original

```
<html>
 <body>
   <p>The solution for
   sshd/login errors:
   …</p>
 </body>
<html>
```

- Text-only

```
The solution for
sshd/login errors:
…
```

Tokenizing

[the] [solution] [for] [sshd] [login] [errors]
…

Chinese Text Example

Text: 今天天气不错。

Unigram:

[今] [天] [天] [气] [不] [错]

Bigram:

[今天] [天天] [天气] [气不] [不错]

Grammar-based:

[今天] [天气] [不错]

Stop Words

- Words that do not help in search and retrieval
  - Function words: a, an, and, the, of, for …
- After stop words removal:

~~[the]~~ [solution] ~~[for]~~ [sshd] [login] [errors]
…

Problem of stop word removal??

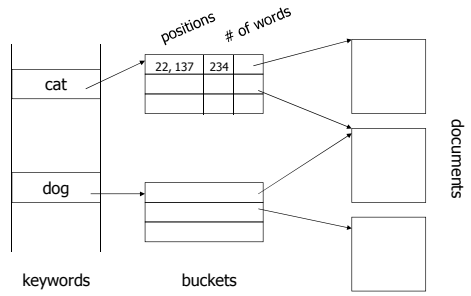
Stemming

- Reduce a word to its stem or root form.
- Examples:

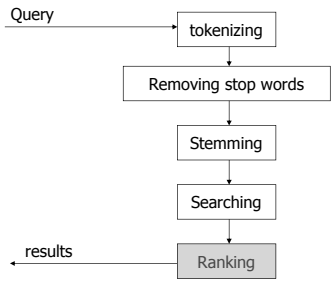
connection, connections
connected, connecting → connect
connective

[solution] [sshd] [login] [errors] → [solve] [sshd] [login] [error]
… …

Inverted Index



Query Processing



Ranking

- How well the document matches the query
  - E.g. weighted vector distance
- How "important" the document is
  - E.g. based on ratings, citations, and links

FTS Implementations

- Databases
  - MySQL: MyISAM tables only
  - PostgreSQL (since 8.3)
  - Oracle, DB2, MS SQL Server, ...
- Standard-alone IR libraries
  - Lucene, Egothor, Xapian, MG4J, …

FTS from the Perspective of Application Developers

- Prepare data
- Create query
- Display result
- (Index)
- (Ranking)

Lucene Overview

- http://lucene.apache.org/
- Originally developed by Doug Cutting
- THE full text search solution for Java applications
- Handles text only – needs external converters to convert other document types to text
- Java API - http://lucene.apache.org/java/3_4_0/api/core/index.html

Example 1: Index Text Files

- `Directory`
- `Document` and `Field`
- `Analyzer`
- `IndexWriter`

Directory

- A place where the index files will be stored
- `FSDirectory` – file system directory
- `RAMDirectory` – virtual directory in memory

Analyzer

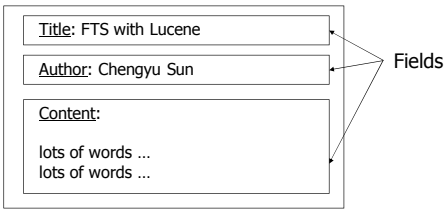
- Pre-processing the document or query text – tokenization, stop words removal, stemming …
- Lucene built-in analyzers
  - WhitespaceAnalyzer, SimpleAnalyzer, StopAnalyzer
  - StandardAnalyzer
    - Grammar-based
    - Recognize special tokens such as email addresses
    - Handle CJK text

IndexWriter

- addDocument(Document)
- close()
- optimize()

Document

- A document consists of a number of user-defined fields



Types of Fields

- Indexed – whether the field is indexed
  - Analyzed
  - Not analyzed
- Stored – whether the original text is stored together with the index

Common Usage of Field Types

Field	Indexed	Analyzed	Stored
String	Y	Y	Y
Large text file	Y	Y	
ID, people's name, date	Y		Y
Non-searchable data			Y

Example 2: Search

- `Query` and `QueryParser`
- `IndexSearcher`
- `TopDocs` and `ScoreDoc`
- `Document` (again)

Queries

full text search

+full +text search

+full +text –search

+title:"text search"

+(title:full title:text) -author:"john doe"

IndexSearcher

- search(Query, int n) – returns the top n results for the query

TopDocs and ScoreDoc

- `TopDocs` contains an array of `ScoreDoc`, which has a *document id* and the *relevancy score* of the document

Factors in Lucene Score

- # of times a term appears in a document
- # of documents that contain the term
- # of query terms found
- length of a field
- boost factor - field and/or document
- query normalizing factor – does not affect ranking

See the API documentation for the Similarity class.

Document (again)

- Methods to retrieve data stored in the document
  - String get(String fieldName)

Handle Rich Text Documents

- HTML
  - NekoHTML
- PDF
  - PDFBox
- MS Word
  - POI
- More at Lucence FAQ - http://wiki.apache.org/jakarta-lucene/LuceneFAQ

Further Readings

- *Lucene in Action* (2ed Ed) by Michael McCandless, Erik Hatcher and Otis Gospodnetic

FTS in PostgreSQL

- Since 8.3
  - tsearch/tsearch2 module before 8.3
- http://www.postgresql.org/docs/9.1/interactive/textsearch.html

Text Search Configuration

- Specify the options to transform a document to a `tsvector` – tokenization, stop words removal, stemming etc.
- psql commands
  - \dF
  - show default_text_search_config;
  - set default_text_search_config=english;
- Change default text search configuration in `$DATA/postgresql.conf`

Sample Schema

```
create table messages (
    id      serial primary key,
    subject varchar(4092),
    content text,
    author  varchar(255)
);
```

Basic Data Types and Functions

- Data types
  - tsvector
  - tsquery
- Functions
  - to_tsvector
  - to_tsquery
  - plainto_tsquery

Query Syntax

plainto_tsquery	to_tsquery
full text search	full & text & search
⇩	full & text | search
full & text & search	full & !text | search
	(! full | text) & search

The Match Operator @@

- tsvector @@ tsquery
- tsquery @@ tsvector
- text @@ tsquery
  - to_tsvector(text) @@ tsquery
- text @@ text
  - to_tsvector(text) @@ plainto_tsquery(text)

Note that there is no tsquery @@ text.

Query Examples

- Find the messages that contain "computer programs" in the content
- Find the messages that contain "computer programs" in either the content or the subject

Create an Index on Text Column(s)

```
create index messages_content_index
  on messages
  using gin(to_tsvector('english',content));
```

- Expression (function) index
- The *language* parameter is required in both index construction and query

Use a Separate Column for Text Search

- Create a tsvector column
- Use a trigger to update the column

Create an Index on the tsvector Column

```
create index messages_tsv_index
  on messages
  using gin(tsv);
```

- The *language* parameter is no longer required

More Functions

- `setweight(tsvector, "char")`
  - A: 1.0
  - B: 0.4
  - C: 0.2
  - D: 0.1
- `ts_rank(tsvector, tsquery)`
- `ts_headline(text, tsquery)`

Function Examples

- Set the weight of *subject* to be "A" and the weight of *content* to be "D"
- List the results by their relevancy scores and highlight the query terms in the results

Using Native SQL in JPA

```
String sql = "select * from employees where id = ?";

entityManager.createNaiveQuery(sql, Employee.class)
    .setParameter(1, employeeId)
    .getResultList();
```

Named Query in Entity Class

```
@Entity
@Table( name="employees" )
@NamedQueries({
    @NamedQuery( name="employee.findAll",
        query="select * from employees" ),
    @NamedQuery( name="employee.findById",
        query="from Employee where id = :id" )
})
public class Employee { …. }
```

A named query can be JPQL or SQL.

Named Query in Hibernate Mapping File

```
<sql-query name="message.search">
   <return class="Message" />
   <![CDATA[
      select * from messages
        where tsv @@ plainto_tsquery(?)
   ]]>
</sql-query>
```

Using Named Query in DAO

```
entityManager
   .createNamedQuery("employee.findAll", Employee.class)
   .getResultList();

entityManager
   .createNamedQuery("employee.findById", Employee.class)
   .setParameter( "id", employeeId )
   .getSingleResult();
```

FTS in Databases vs. Standalone Libraries

- Pros??
- Cons??
