

CS202 Java Object Oriented Programming

Introduction to Classes and Objects

Chengyu Sun
California State University, Los Angeles

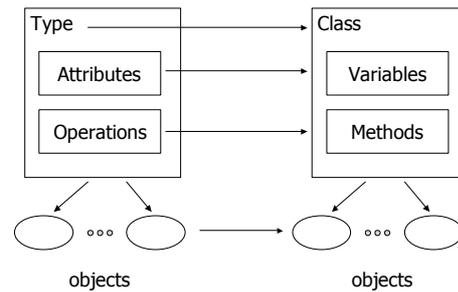

Overview

- ◆ **Class**
 - Variables and variable scope
 - Methods
 - Constructors and garbage collection
 - Keyword `this`
- ◆ **Object**
 - Reference
 - Assignment, equality, and array of objects
 - Pass by reference and pass by value
- ◆ **Keyword `static`**

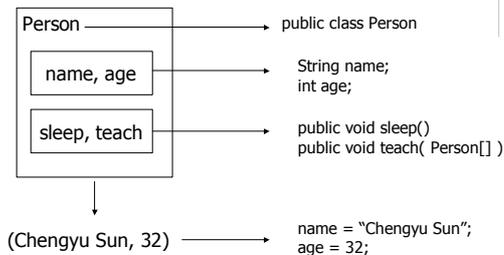

Philosophy of Object Oriented Programming Languages

- ◆ The world consists of objects
- ◆ Each object is associated with some attributes and operations
 - Attributes
 - Name, age, height, weight, eye color etc.
 - Operations
 - Walk, talk, sleep, take etc.
 - Sit on a chair, drive a car, read a book ...
- ◆ The same type of objects share the same attributes and operations

From Concept to Code

From Concept to Code Example

Benefits of OO Programming

- ◆ Encapsulation
- ◆ Inheritance
- ◆ Polymorphism

Example: A Simple Account Management System

Account

◆ Attributes

- Account number
- Owner's name
- Balance (>=0)

◆ Operations

- Check balance
- Deposit
- Withdraw
- Transfer

Account Class

◆ Header

◆ Members

- Class variables, a.k.a. fields
 - ◆ accn, owner, balance

▪ Methods

- ◆ Constructors
- ◆ balance(), deposit(), withdraw(), transfer()

Class Variables

◆ Just like *local* variables

- Type
- Name
- Value

◆ Except that they are declared outside all methods

◆ Can be used in all methods

```
public class Account {
    int accn;
    String owner;
    double balance=0.0;

    // methods
    ... ..
}
```

Variable Scope

◆ Parts of the code where the variable can be used

◆ Usually from the declaration of the variable to the end of the code module (often marked with a "}") where the variable is declared

◆ Scope of class variables is the whole class

◆ *Shadowing*

Variable Scope Example

```
public class Scope1 {
    int x = -1;

    public void test()
    {
        int x = 10; // System.out.println(x) ??

        for( int i=0 ; i < 10 ; ++i )
        {
            int x = 5; // System.out.print(x) ??
        }
        System.out.println( i ); // ??

        System.out.println( x + " " + y );
    }

    int y = -2;
}
```

```
switch( c )
{
    case 'a':
        int tmp=5;
        break;

    case 'b':
        int tmp=7;
        break;
}
```

Variable Scope Example

```
public class Scope1 {
    int x = -1;

    public void test()
    {
        int x = 10; // Shadowing

        for( int i=0 ; i < 10 ; ++i )
        {
            int x = 5; // Error! Scope conflict
        }
        System.out.println( i ); // Error! Out of Scope

        System.out.println( x + " " + y );
    }

    int y = -2;
}
```

```
switch( c )
{
    case 'a':
        {
            int tmp=5;
            break;
        }

    case 'b':
        int tmp=7;
        break;
}
```

Constructors of Account

```
/** Constructor. creates an account with zero balance */
public Account( int accn, String owner )
{
    this.accn = accn;
    this.owner = owner;
}

/** Constructor. creates an account */
public Account( int accn, String owner, double balance )
{
    this( accn, owner );
    this.balance = balance > 0 ? balance : 0;
}
```

Constructors

- ◆ A special type of methods
 - Name is the same as the class name
 - No return type (not even `void`)
- ◆ Purpose
 - Allocate the memory
 - Initialize fields
- ◆ There could be more than one constructors
 - Default constructor `Classname ()`
 - A constructor can call another constructor as the *first* statement of the constructor

Overloading

- ◆ Methods have the same name but different signatures

```
System.out.println( char )
System.out.println( boolean )
System.out.println( int )
System.out.println( String )
```

... ..

Keyword `this`

- ◆ A reference to an object itself
 - De-shadowing
- ◆ A reference to a constructor

```
int x = -1;

void foo()
{
    int x = 10;

    System.out.println( x );
    System.out.println( this.x );
}
```

Garbage Collection

- ◆ There are no *destructors* in Java
- ◆ Freeing memory allocated to objects is done automatically – garbage collection
- ◆ Advantage
 - Simplifies programming
 - Safer and more robust programs
 - No dangling pointers
 - Greatly reduced memory leaks
- ◆ Disadvantages
 - Less efficient

Other Methods of Account

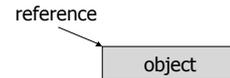

- ◆ `double balance()`
- ◆ `double deposit(double amount)`
- ◆ `double withdraw(double amount)`
- ◆ `double transfer(double amount, Account a)`

Usage of Classes

- ◆ Declaration `Account a; // declaration`
- ◆ Allocation and initialization `a = new Account(100000, "Chengyu", 10);`
- ◆ Calling class methods `// 3 in 1
Account b = new Account(100001, "Sun", 20);`
- ◆ Classes versus Objects `a.deposit(20);
b.withdraw(30);
a.transfer(10, b);`

Object Reference

- ◆ Object name is also called the *reference* of the object
 - Similar to *pointer* in C/C++

Object Assignment

```
public class Foo {
    int n;
    public Foo() { n = 0; }
    public Foo( Foo f ) { n = f.n; }
    public void inc() { ++n; }
    public void print()
    {
        System.out.println(n);
    }
}

Foo a = new Foo();
Foo b = a;
Foo c = new Foo(a);

a.inc();
b.inc();
c.inc();

a.print(); // ??
b.print(); // ??
c.print(); // ??
```

Object Equality

- ◆ By reference `System.out.println(a == b); // ??
System.out.println(a == c); // ??`
 - ==
- ◆ By value `equals()`
 - equals()

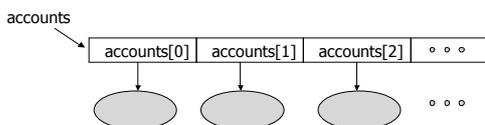

Add another method to Foo:

```
public boolean equals( Foo a )
{
    return n == a.n;
}
```

Array of Objects

```
Account accounts[];
accounts = new Account[1000]; // allocation of references

// initialization has to be done for each element
Accounts[0] = new Account( 100000, "Chengyu", 10.0 );
Accounts[1] = new Account( 100001, "Sun", 20.3 );
... ..
```

Parameter Passing Example

```
public class Foo {
    public int n = 0;
}

int a = 0;
Foo f = new Foo();

void inc( int a, Foo f )
{
    ++a;
    ++f.n;
}

inc( a, f );
System.out.println( a ); // ??
System.out.println( f.n ); // ??
```

Parameter Passing

- ◆ Pass by value
 - All primitive types
 - Safe
 - May not be efficient
- ◆ Pass by reference
 - All class types, including arrays
 - Less safe
 - Efficient

Keyword `static`

- ◆ A static member of a class is shared by all objects of the class

```
Foo f1 = new Foo();
Foo f2 = new Foo();

f1.print(); f2.print(); // ??

f1.inc();
f2.inc();

f1.print(); f2.print(); // ??
```

```
public class Foo {
    static int a = 0;
    int b;

    Foo() { b = 0; }

    public void inc()
    {
        ++a; ++b;
    }

    public void print()
    {
        System.out.println(a);
        System.out.println(b);
    }
}
```

Reference Static Members

- ◆ Reference non-static members – `objectName.memberName`
- ◆ Reference static members – `ClassName.memberName`

```
ConsoleReader in = new ConsoleReader();
double r = in.readDouble();

double area = Math.PI * Math.pow(r,2);
```

Example: Improved Account Class

- ◆ Original constructors of Account:
 - `public Account(int accn, String owner, double balance)`
 - `public Account(int accn, String owner)`
- ◆ Specifying account number in the constructor is not good
- ◆ Solution: add a static field
 - `static int nextAccn = 100000;`

New Constructors of Account

```
/** Constructor. creates an account with zero balance */
public Account( String owner )
{
    accn = nextAccn++;
    this.owner = owner;
}

/** Constructor. creates an account */
public Account( String owner, double balance )
{
    this( owner );
    this.balance = balance > 0 ? balance : 0;
}
```
